Disclosures

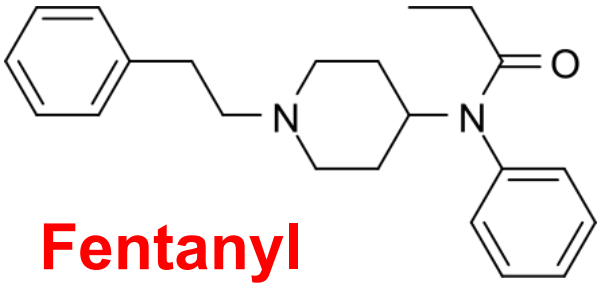
- Within the past 3 years, I have received research funding and/or study medications from Alkermes, BioXcel, Corbus, GoMedical (NIDA grant), Intra-cellular Therapies (NIDA grant), Janssen, and Lyndra (NIDA grant)

- I have also consulted for Alkermes, Mallinckrodt, and Opiant

Goals

- Current public health impact of fentanyl
- Pharmacology of fentanyl
- Impact on treatment of opioid use disorder (OUD)
  - Preclinical data
  - Early clinical data
- Possible solutions

What is fentanyl?



Fentanyl

- ✓ Potent synthetic opioid that is currently approved by the FDA
- ✓ First used medically in the 1960's as a general anesthetic
- ✓ Now used as a transdermal patch, lollipop, dissolving tablet and nasal spray for management of chronic or breakthrough pain

But Pharmaceutical Fentanyl is Not Driving the Current Epidemic

(Volkow, NIDA Council, May 2017)

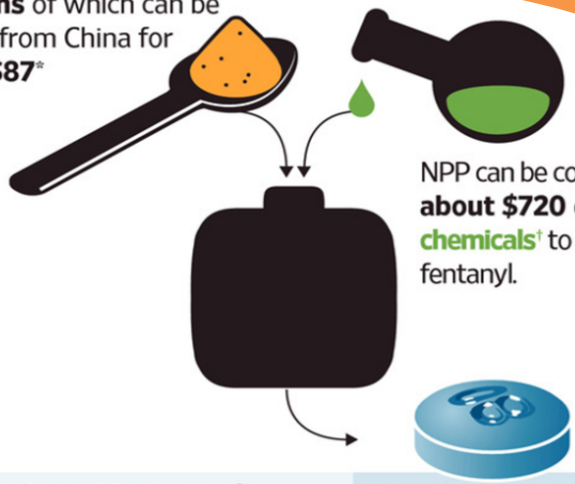
Fentanyl Synthesis from NPP

- **Large profit margin**
- **Easy to synthesize**
- **Easy to transport**

Criminal Chemistry

Traffickers manufacturing fentanyl often purchase the key ingredient from China, which doesn't regulate its sale. Here's how the chemical building blocks become a highly profitable street drug.

The key ingredient is NPP, 25 grams of which can be bought from China for **about $87***



NPP can be combined with **about $720** of other chemicals† to produce fentanyl.

The resulting 25 grams of fentanyl cost about $810 to produce...

...and are equivalent to up to $800,000 of pills on the black market.

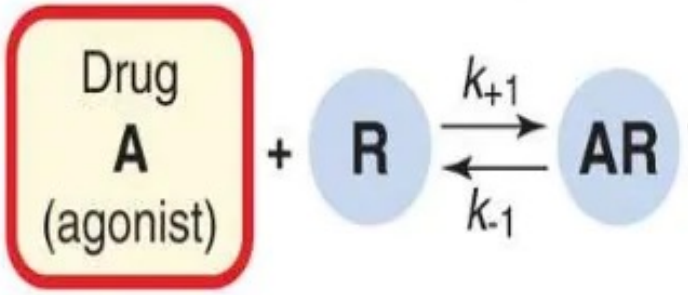
AFFINITY



K_d = dissociation constant (k_{off}/k_{on})

FIGURE 1.9 The Langmuir adsorption isotherm representing the binding of a molecule to a surface. Photo shows Irving Langmuir (1881–1957), a chemist interested in the adsorption of molecules to metal filaments for the production of light. Langmuir devised the simple equation still in use today for quantifying the binding of molecules to surfaces. The equilibrium is described by condensation and evaporation to yield the fraction of surface bound (θ_1) by a concentration μ.

[a]In this study by Schmid et al., the authors state that the assay was performed in the presence of Na (100 mM), but the high affinity for both ligands (low nM values) would indicate the absence of Na. Either way it does not matter as the ratio is close to 1.

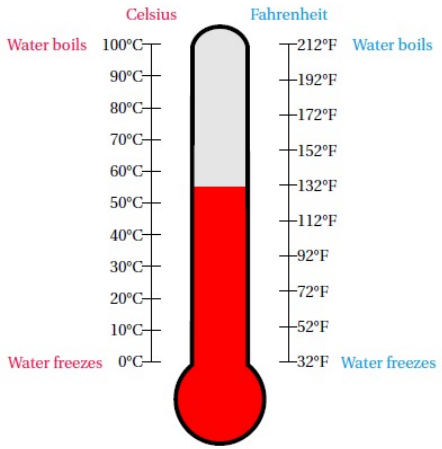
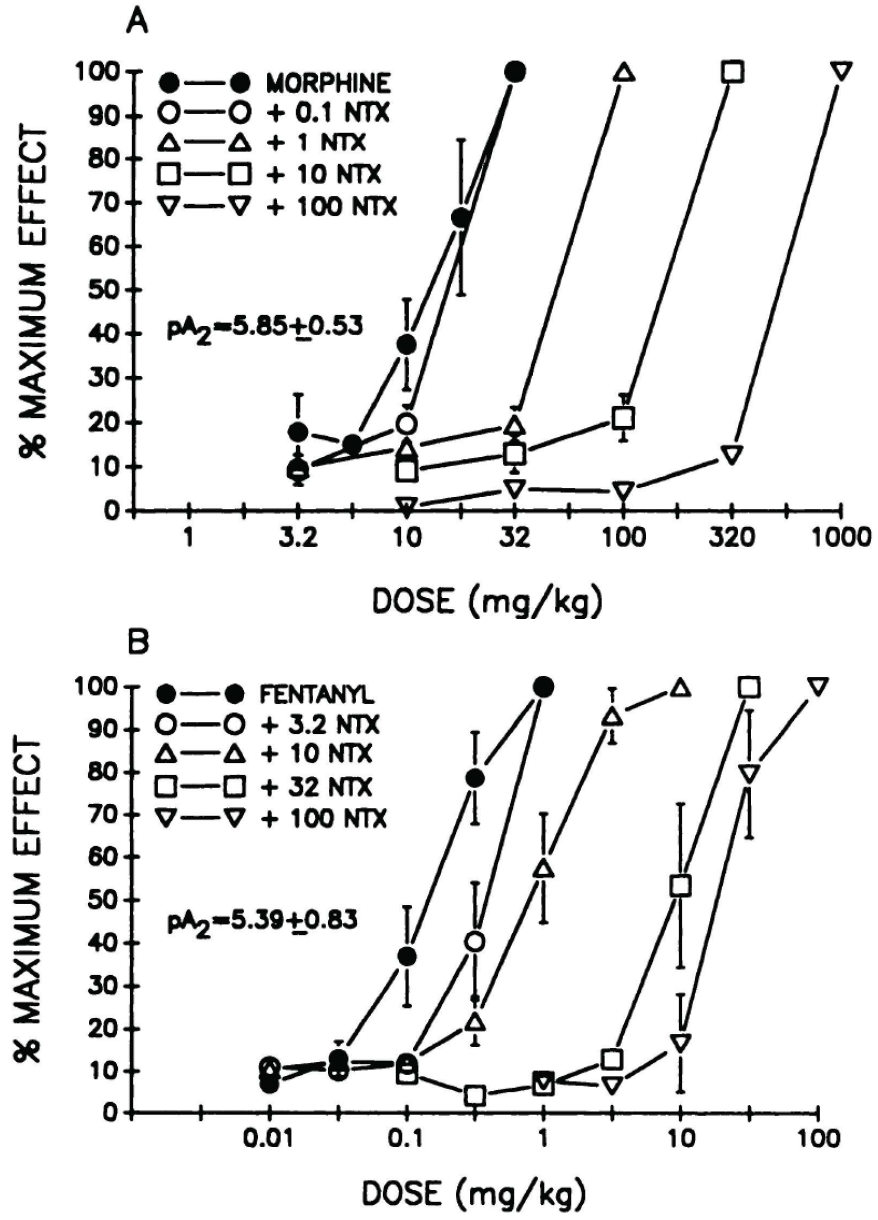
Antagonists: Naltrexone or C-CAM

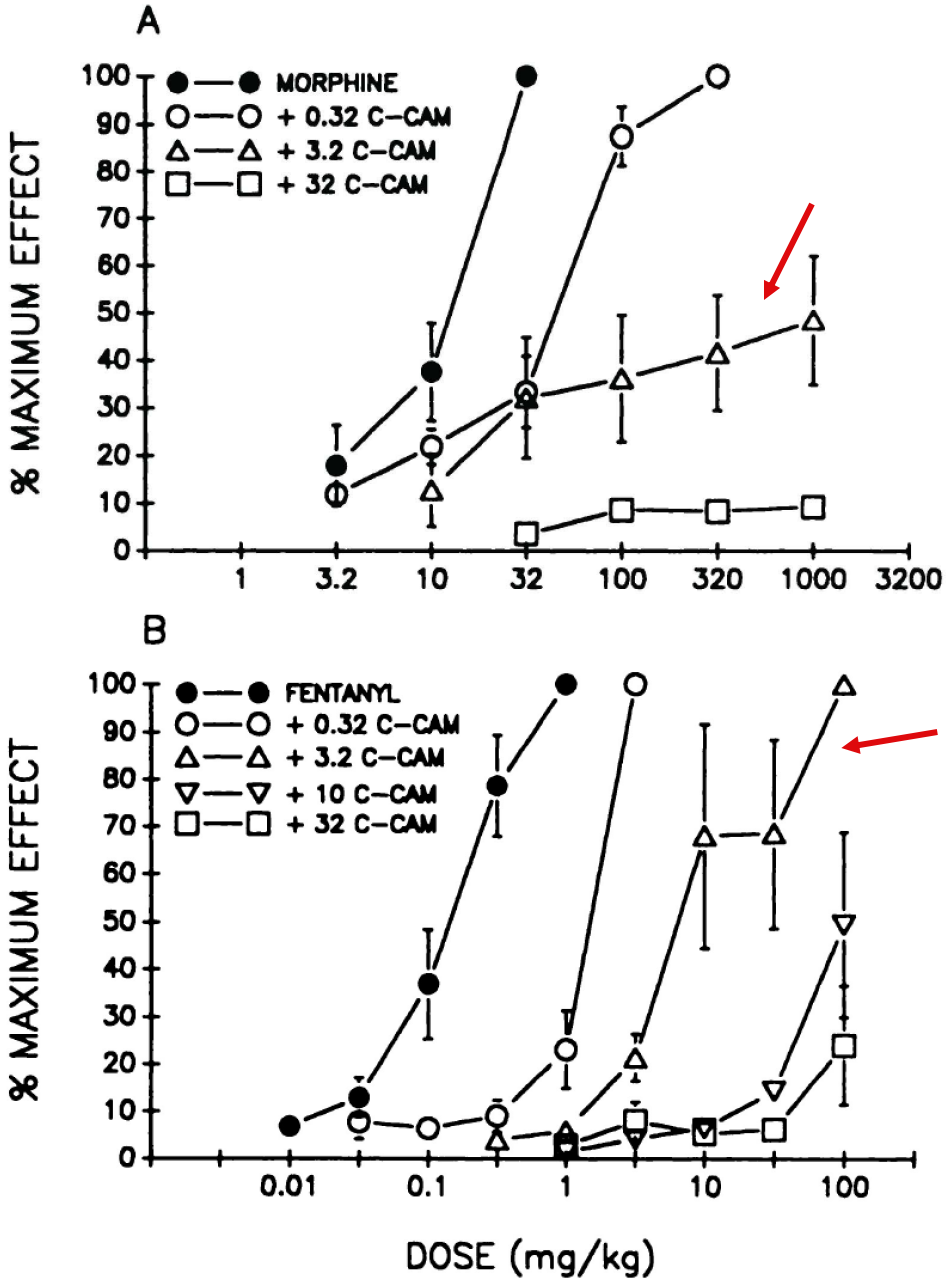
Test drugs: Morphine, fentanyl





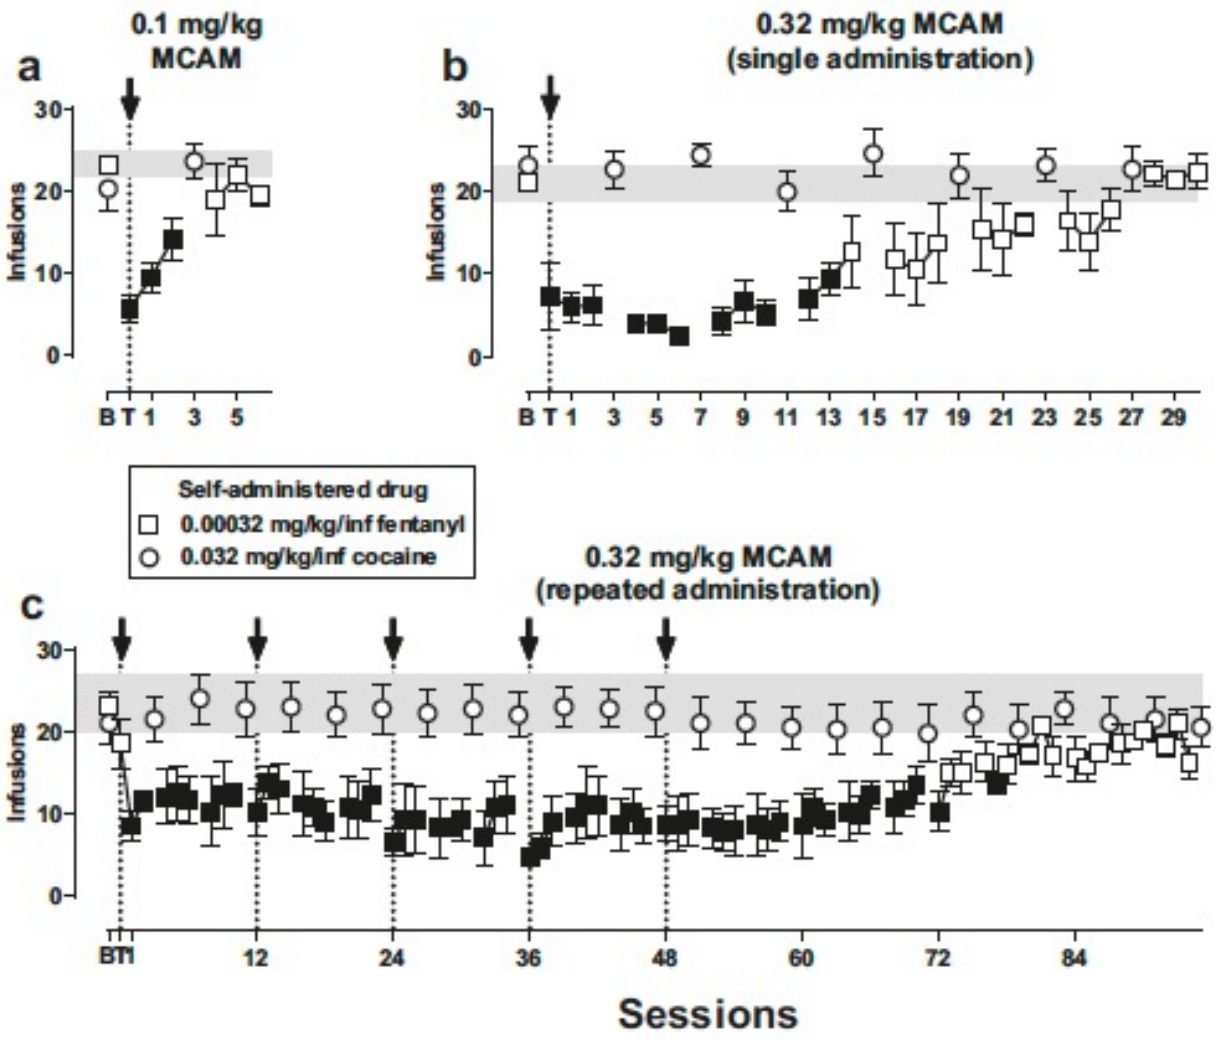
The potency of naltrexone against morphine and fentanyl was the same, suggesting that they were producing their effects through the same receptors (μ).

Comer et al (1992) J Pharmacol Exp Ther 262(3): 1051-1056



However, higher doses of an irreversible antagonist were needed to produce downward shifts in the dose-effect curve for fentanyl compared to morphine.

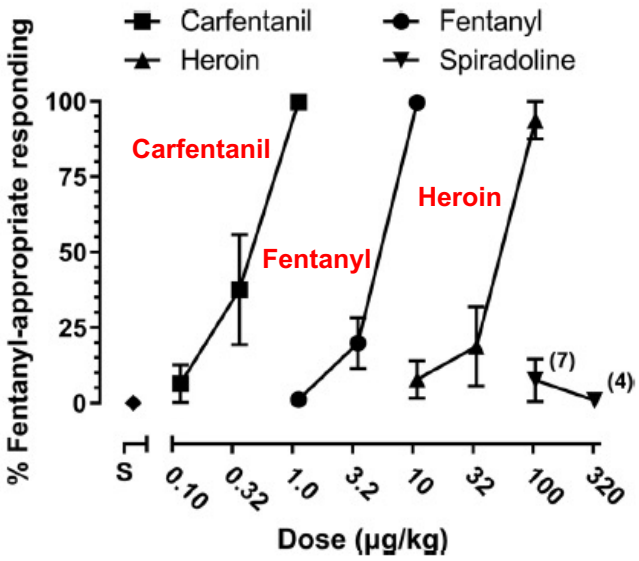
Comer et al (1992) J Pharmacol Exp Ther 262(3): 1051-1056



MCAM, a pseudoirreversible antagonist, produced a long-lasting reduction in fentanyl self-administration in rhesus monkeys.

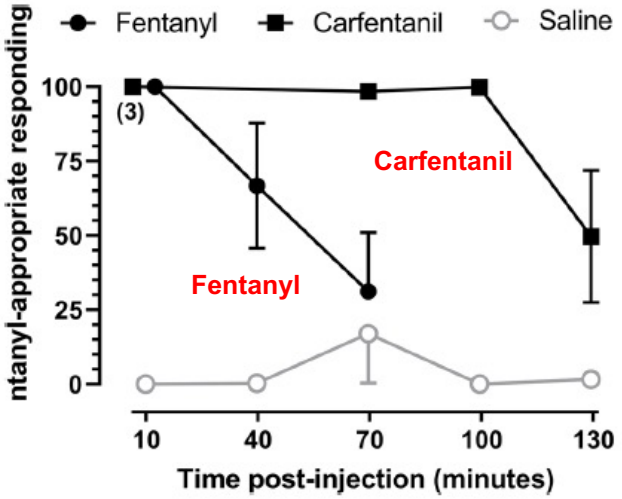
Maguire et al (2020) Neuropsychopharmacol 45: 1986-1993

THE ANTAGONIST IS IMPORTANT – COMPETITIVE VS NON-COMPETITIVE INTERACTIONS



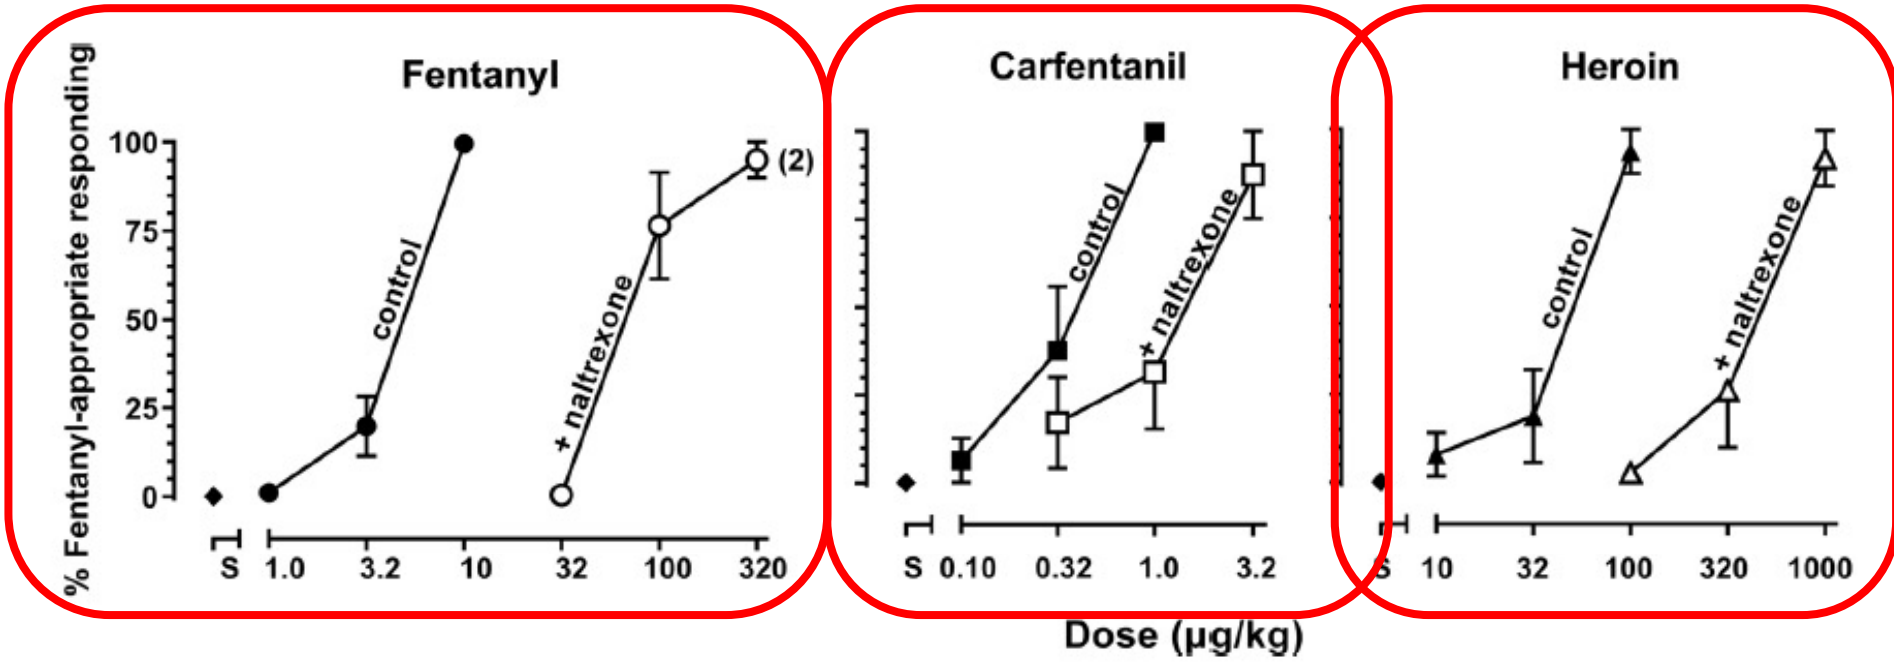
Fentanyl and carfentanil produce effects that are similar to heroin in rats.

But carfentanil produces longer lasting effects than fentanyl.



Flynn and France (2021) Drug and Alcohol Dependence 221: 108599

Although naltrexone antagonizes fentanyl and heroin to a similar extent, it is less effective against carfentanil.



Flynn and France (2021) Drug and Alcohol Dependence 221: 108599

THE AGONIST IS IMPORTANT TOO – FENTANYL VS CARFENTANIL

What about fentanyl?

- No laboratory-based studies have measured the ability of buprenorphine (or methadone or naltrexone) to antagonize the effects of fentanyl in humans
- One retrospective cohort study showed that treatment retention and opioid abstinence at 6 months after initiation of buprenorphine did not differ in patients who tested positive for fentanyl versus heroin at initiation of buprenorphine treatment (Wakeman et al., 2019) – but small sample sizes
- Another retrospective cohort study showed that treatment retention at 12 months after initiation of methadone did not differ in patients who tested positive versus negative for fentanyl at initiation of treatment (Stone et al., 2020) – but fentanyl use during treatment was common; no fatal overdoses

Initiation of Buprenorphine Treatment

Withdrawal can be severe in fentanyl users who are transitioning to buprenorphine

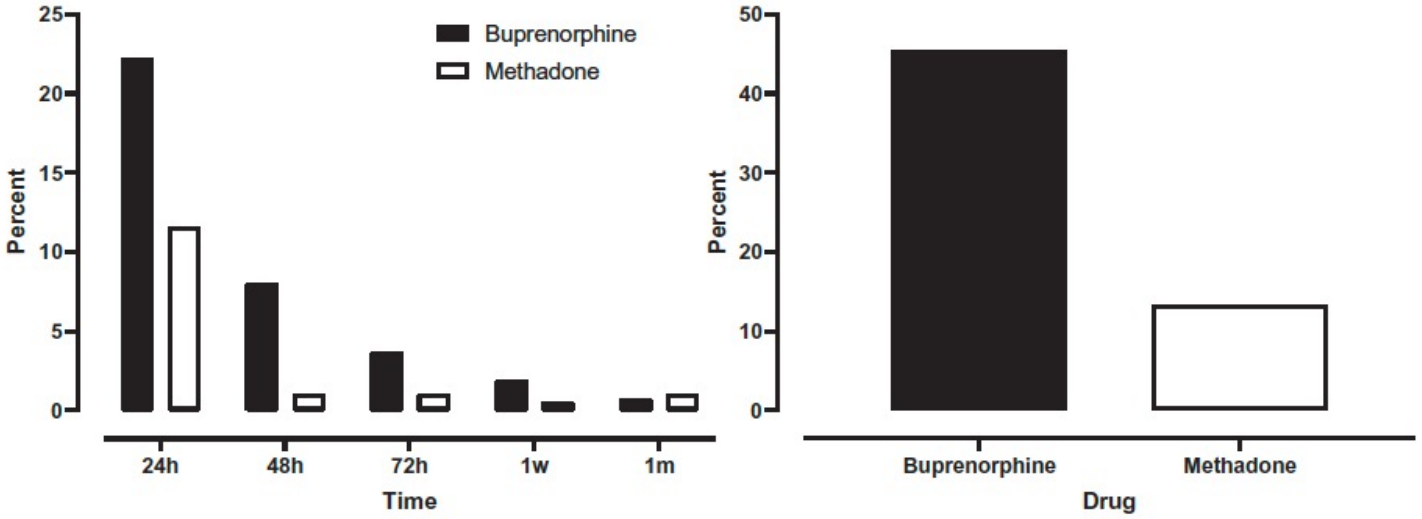

FIGURE 1. (LEFT) Percentage of patients who endorsed "probably" or "definitely" using fentanyl and who reported severe withdrawal after use of buprenorphine (n = 250) or methadone (n = 30) as a function of the shortest amount of time endorsed (24, 48, or 72 hours, 1 week, and 1 month) after fentanyl use. (RIGHT) Percentage of patients who endorsed "probably" or "definitely" using fentanyl and who reported severe withdrawal after use of buprenorphine (n = 69) or methadone (n = 20) after taking fentanyl; only patients with experience with both buprenorphine and methadone after fentanyl use were included this analysis.

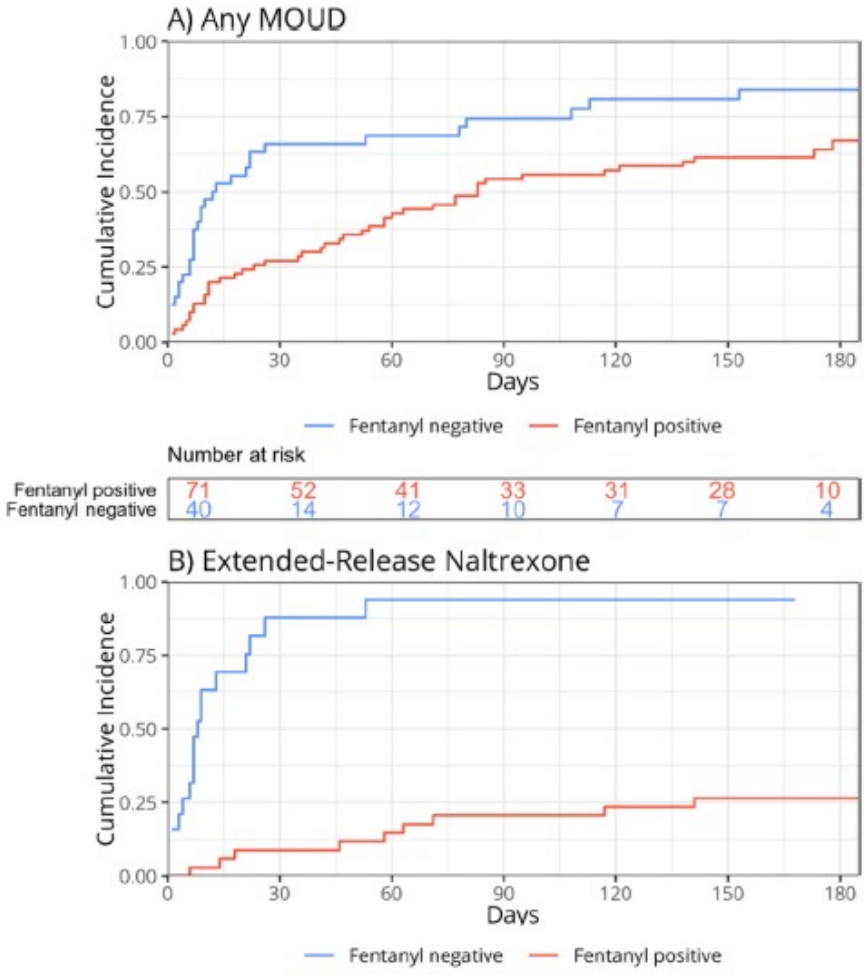
COMMENTARY

A Plea From People Who Use Drugs to Clinicians: New Ways to Initiate Buprenorphine are Urgently Needed in the Fentanyl Era

Kimberly L. Sue, MD, PhD, Shawn Cohen, MD, Jess Tilley, and Avi Yocheved

J Addict Med • Volume 00, Number 00, Month/Month 2022

Initiation of Naltrexone Treatment



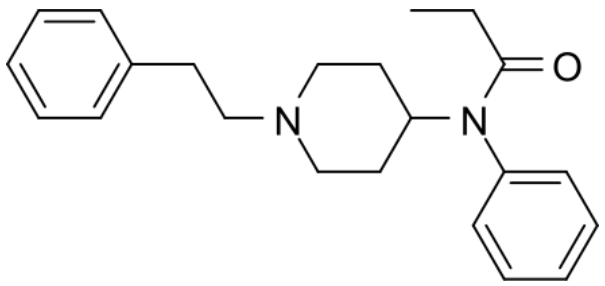
Fentanyl+ patients half as likely to initiate treatment overall

Fentanyl+ patients 11x less likely to initiate treatment with naltrexone

No evidence that fentanyl related to bup initiation

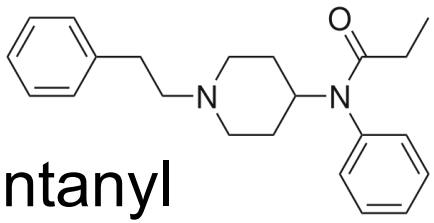
Cook et al. DAD (2021)

What can we conclude so far?

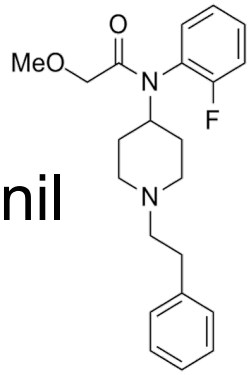


- ✓ Fentanyl is potent, has a rapid onset of action, and is short acting
- ✓ Naltrexone is effective in preventing the fentanyl-induced responses but is less effective against carfentanil (preclinical data)
- ✓ Naloxone appears to be less effective against fentanyl overdose (preclinical data and clinical case reports)

Unanswered Clinical Questions

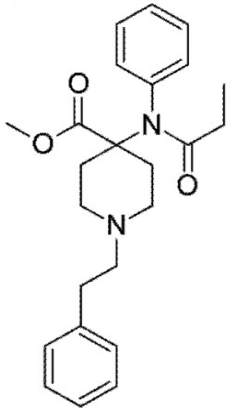


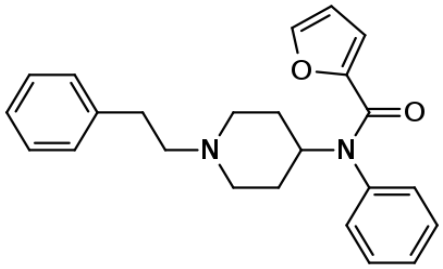
Fentanyl



Ocfentanil

Carfentanil





Furanyl Fentanyl

- ✓ How well do methadone, buprenorphine, and naltrexone work for treating OUD in patients using fentanyl? Retrospective studies suggest that buprenorphine and methadone are effective.
- ✓ But what about the analogs?
- ✓ How do we most effectively transition patients from fentanyl to these treatment medications?
- ✓ How do we most effectively manage fentanyl-related overdoses?

So what do we do?

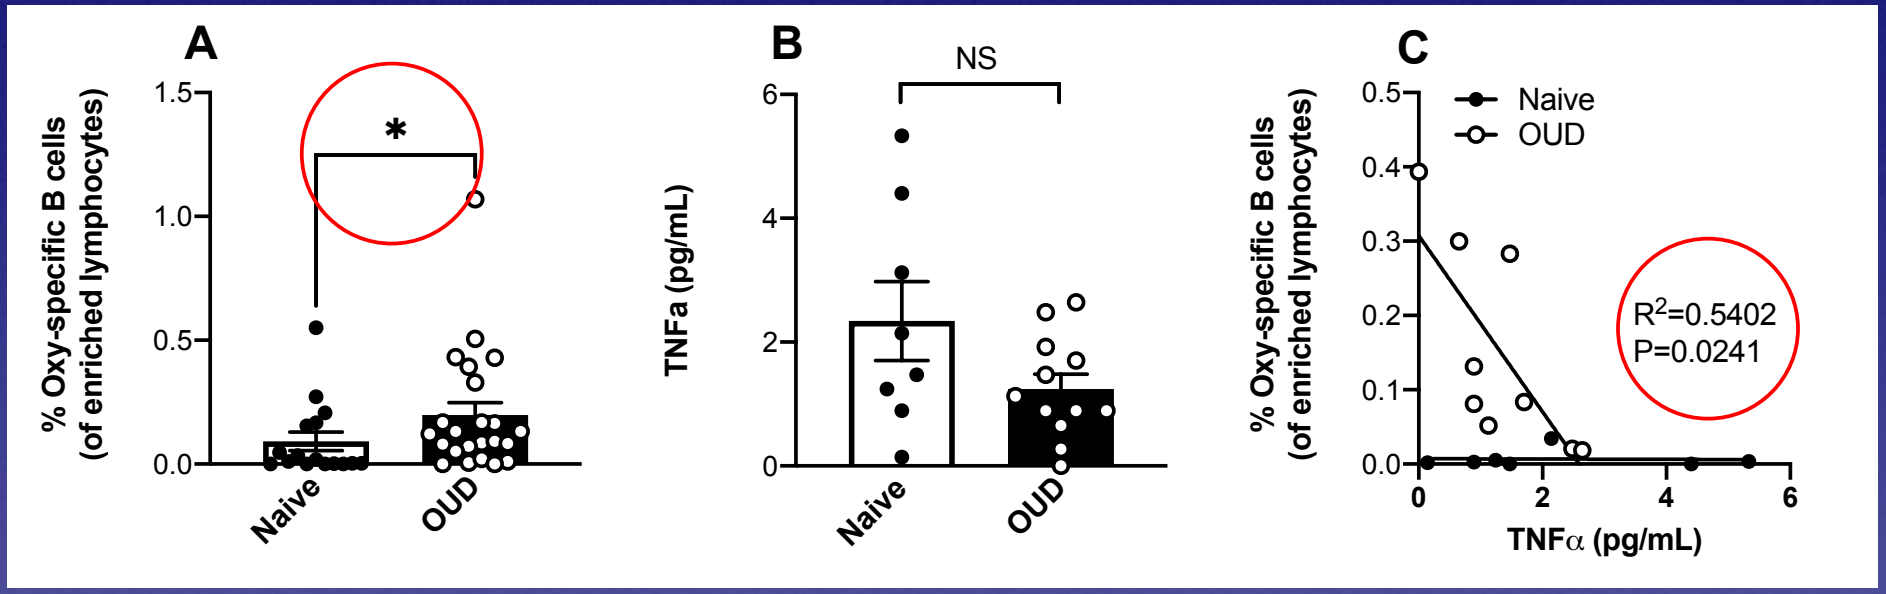
Comparison of opioid users and naïve individuals' opioid-specific B cells and TNFα expression



- Significant difference in the frequency of opioid-specific B cells
- No difference in the expression of TNFα
- Correlation between TNFα expression and opioid-specific B cells only for opioid users
